WARNING
BEFORE BEGINNING INSTALLATION OF THIS MURPHY PRODUCT
- Disconnect all electrical power to the machine.
- Make sure the machine cannot operate during installation.
- Follow all safety warnings of the machine manufacturer.
- Read and follow all installation instructions.

CAUTION: Certain dangers to human safety and to equipment may occur if some equipment is stopped without pre-warning. It is recommended that monitored functions be limited to alarm-only or to alarm before shutdown.

General Information

Description
The 2 and 2-1/2 in. (51 and 64 mm) dial size Murphygage and Swichgage instruments are diaphragm-actuated, pressure or vacuum gauges with a 1/8-27 NPTM pressure port connection (2 pressure ports for differential pressure models). Models with face-adjustable contact(s) are rated for 2 A @ 30 V (pilot duty). If the gage case is steel (20P, 25P, 20DP, 25DP etc.) the ground path for the contact circuit is through the case. Therefore, the case must be installed in the ground plane of the electrical power supply.

Alarm Before Shutdown Models
The 20PABS, A20PABS, 25PABS and A25PABS feature a front limit contact for equipment shut-down and an internal SPDT snap switch for Alarm Before Shut-Down. When the low side (preset point) of the snap switch trips, the N.C. terminal completes a circuit to activate an alarm. A continued decrease in pressure will complete the shutdown circuit. An increase in pressure of approximately 10% of scale is necessary before the snap-switch (alarm) will reset and open the circuit.

Typical Tatletale® Magnetic Switch
Murphy manufactures several, patented Magnetic Switches for protection of the pilot duty Swichgage contacts and to ensure positive shut-down of equipment. Tatletale annunciators show the cause of shut-down. The first one to trip will lockout all other Tatletale annunciators. Be sure the type of magnetic switch or Tatletale annunciator matches the power source used to trip it.

Notes: Select a scale so your normal operating pressure is in the upper middle of the scale.

Panel Mounting
All models can be installed in a panel from 0.032 to 0.250 in. (1 to 6 mm) thick. Remove the mounting bracket and insert the gage from the front side of the panel. Replace bracket and secure it. Do NOT overtighten. (See Figure 2)

Connecting the Pressure Port
1. Pressure tubing is generally not provided. Use of good quality flexible pressure tubing/hose and fittings is strongly suggested. Use at least 3/16 in. (5 mm) I.D. tubing. If using copper or rigid tubing, install at least 12 in. (305 mm) flexible hose from the gauge to the rigid tubing. This prevents damaging vibration from reaching the gage. For most models a pulsation orifice, within the pressure port, is provided and it is removable for cleaning (Figure 2).

Tatletale Annunciator

Products covered by this literature comply with EMC Council directive 89/336/EEC regarding electromagnetic compatibility except as noted.

Values in ( ) are mathematical conversions from psi to kPa/MPa—they do not reflect second scale range. U.S.A. standard scale is psi/kPa; U.K. standard scale is psi/bar. Consult factory for other scales.

** Low settings for Hi/Lo option same as standard settings. Hi/Lo option available for 20P/25P models only.
† SPDT Snap-switch is the alarm switch.

### Connecting Vacuum Models

The vacuum instruments measure intake manifold vacuum and gives an indication of the load applied to the engine.

1. Mount the gage in a suitable location so that the face is visible and easily accessible.

**CAUTION:** Make sure not to foul the pressure orifices with pipe dope or dirt or the SWICHGAGE instrument will not operate.

2. Connect suitable tubing to the 1/8-27 NPT port of the gage and to an open port in the intake manifold. Mounting kit V5179 is suggested and includes tubing and necessary fittings. The manifold fitting is 1/4 NPT. Figure 3 shows a typical mounting using V5179 kit. A Murphy PD2160 is also recommended.

3. Be sure connections are tight—gage will not operate properly if line leaks.

### Connecting Differential Pressure Models

Differential pressure models are typically applied to indicate restriction in oil/fuel filters. The “Hi” pressure port (center mounted) is piped to the Inlet side of the filter. The “Low” pressure port (top center mounted) is piped to the Outlet side of the filter.

**CAUTION:** Make sure not to foul the pressure orifices with pipe dope or dirt or the SWICHGAGE instrument will not operate.

1. To connect the high pressure tubing use at least 3/16 in. (5 mm) I.D. flexible pressure tubing/hose and fittings. If using copper or rigid tubing, install at least 12 in. (305 mm) flexible hose from the gage to the rigid tubing (to prevent damaging vibration to the gage, see Figure 4).

**WARNING:** Failure to use a second wrench on the Low Pressure port when tightening tube fittings may result in damage to the internal mechanisms.

**IMPORTANT:** NEVER exceed maximum static pressure or differential pressure ratings for your gage range; stated in chart below.

*Values are shown in psi, (kPa/MPa) and [bar]. Values in kPa/MPa and bar are mathematical conversions from psi—they do not reflect actual second scale range.

---

**Figure 3**

**Figure 4**
Setting the Swichgage instrument contacts

**IMPORTANT:** If the Swichgage has a lockout push button on the face, a contact setting higher than the factory setting will make the lockout device inoperative.

For 20PE, 25PE, 25DP, A20PE, A25PE and A25DPE models the switch trip point **CANNOT** be set at either the lowest or the highest extremes of the scale. Trip point **MUST** allow for the switch reset differential. **For adjustable switch versions,** the switch point is adjustable **ONLY** over the lower half of the scale.

1. All contacts are set using a 1/16 in. hex wrench (Figure 5).
2. Some models such as A20PE, A25PE, etc. may not have field adjustment. **Consult the factory if in doubt. For adjustable models,** 1/4 turn clockwise lowers switch operating point approximately 7% of scale.
3. Observe the “normal operating” pressure or vacuum readings. Set the contact slightly below minimum reading observed or slightly **above** minimum pressure recommended by equipment manufacturer. For differential pressure models set the contact slightly below the desired maximum differential pressure.

### Wiring Installation

**WARNING:** DISCONNECT ALL ELECTRICAL POWER BEFORE BEGINNING THE WIRING INSTALLATION.

For battery ignition systems, disconnect the battery ground strap. Face adjusted pointer type contacts are pilot duty. **DO NOT EXCEED CONTACT RATINGS ON ANY SWICHHGAGE® MODEL.**

### Testing the Contacts

1. With equipment running: use a 1/16 in. hex wrench to rotate contact until it touches the pointer. **DO NOT force contact against the gage pointer.** Equipment should shut down and/or alarm should operate. Reset the contact (See Figure 5).
2. **VERY IMPORTANT** Each time you start the machine, observe that the SWICHHGAGE® is indicating pressure or vacuum. Visual inspection and regular testing should be normal procedure to ensure proper operation and to achieve maximum results from your Swichgage instrument.

The pictorial below shows typical wirings for each base model. Look for specific typical wiring diagram with your base model number and wire accordingly.

The pointer is shown in the **Shelf Position**. Face adjusted pointer type contacts are rated pilot duty 2 A @ 30 VAC/DC; 3 A @ 30 VDC; 4 A @ 125 VAC.

**CAUTION:** On some models pointer contact and ABS switch share the same “Common”. Voltage source must be the same. Maximum voltage is 30 V. Consult factory for applications with 120 VAC systems.

---

20 and 25 Series models wire leads are 18 AWG or 20 AWG, 12 in. (305 mm) long. A20 and A25 Series models have number 4 or number 6 screw terminals.

When installing the Swichgage instrument on an ungrounded panel, you MUST provide a ground wire from the Swichgage instrument to a common ground. Install ONLY in a 12 or 24 V system. Warning lights or audible signal must be of the same voltage as the battery. Current draw should never exceed Swichgage contact ratings.

**CAUTION:** Ordinary incandescent lights are damaging to Swichgage contacts. We recommend using our direct connected alarms TL-7 flashing lamp and/or SAH mini-siren.
Installing The Magnetic Switch

**WARNING:** DISCONNECT THE BATTERY OR POWER SOURCE BEFORE BEGINNING THE INSTALLATION. SEE SPECIFIC WIRING INSTRUCTIONS PACKED WITH EACH MAGNETIC SWITCH OR TATTLETALE ANNUNCIATOR.

1. Mount with electrical lugs down. Drill mounting holes in panel.
2. Clean away burrs and filings. Position the magnetic switch in the panel, making sure the pilot stud is in place.
3. Add decal, then washer, then nut and tighten.

NOTE: Murphy components are easily wired and maintained. Use good quality wire and terminals. The type of magnetic switch differs for various applications. See typical wirings below. Wiring and instructions are packed with each magnetic switch.

DO THIS FIRST: Look for broken wiring, frozen pointer, dirty contacts (will not make), burnt pointer or contact. Verify that all wiring is intact and connections are tight. Verify that Swichgage has not been damaged (hit or dropped). Verify that there is pressure/vacuum supplied to the gage. Verify that the Swichgage is operative (it reads). Verify that the alarm or shutdown device is fully operable; and check other components such as spark plugs, ignition, fuel pump and filter, etc. Reset magnetic switch and verify that it stays latched.

### Troubleshooting

<table>
<thead>
<tr>
<th>SYMPTOM</th>
<th>CAUSE</th>
<th>TEST/REMEDY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engine will not start.</td>
<td>1. Short or open circuit, be sure the magnetic switch latches and puts out power to the run device or removes ground (ignition). Check for power/ground at run device. 2. Control circuit overloaded by accessories (blown fuse in magnetic switch). 3. False ground in control circuit.</td>
<td>1. Reset magnetic switch and make sure it stays latched. Refer to installation instructions for 518PH magnetic switch (provided with unit). 2. Find blown fuse and replace (use 14 A fuse). Reroute the accessories. 3. Repair.</td>
</tr>
<tr>
<td>False shutdown.</td>
<td>1. Swichgage circuit has intermittent open or short. 2. Vibration causes the Magnetic Switch to trip.</td>
<td>1. Check all wiring and repair/replace as necessary. 2. Repair and relocate the switch as needed.</td>
</tr>
<tr>
<td>Swichgage closes but does not trip the magnetic switch or kill the engine.</td>
<td>1. Incomplete shutdown circuit. 2. Dirty Swichgage contacts. 3. Ignition not providing power to primary terminal post. 4. Swichgage case may not be grounded. 5. Incorrect magnetic switch for type of power.</td>
<td>1. Locate open circuit and repair. 2. Clean and check that contacts make. 3. Repair ignition. 4. Ground case. 5. Replace with correct magnetic switch.</td>
</tr>
<tr>
<td>Magnetic switch tripped but engine is still running.</td>
<td>1. Open circuit between the magnetic switch and the shutdown device. 2. Lost ground to kill the engine.</td>
<td>1. Check wiring from magnetic switch to shutdown device, repair or replace. 2. Check all wiring and connections and repair.</td>
</tr>
<tr>
<td>Pointer/contact burned-in two.</td>
<td>Without exception this condition is caused by incorrect wiring or short circuit.</td>
<td>Recheck wiring; replace Swichgage or return for repair.</td>
</tr>
